Re: Patent Application of **Compaq Computer Corporation** filed herewith:

Inventorship: **Meyer et. al** (John E. Meyer, John S. Harsany, Tim J. Lyons, David E. Gorman, Hung K. Dinh)

Title: **Automatic Capture and Comparison of Computer Configuration Data** (Docket No. **P98-2369**)

Honorable Commissioner:

Enclosed are PTO forms PTO/SB/05 and PTO/SB/17, with application elements and accompanying application parts as listed therein.

Respectfully submitted,

Betty Formby
Betty Formby, Registration No. 36,536

Automatic Capture and Comparison of Computer Configuration Data

U.S. Patent Application of:

<u>John E. Meyer,</u>	Inventor
<u>John S. Harsany,</u>	Inventor
<u>Tim J. Lyons,</u>	Inventor
<u>David E. Gorman,</u>	Inventor
<u>Hung K. Dinh,</u>	Inventor

Compaq Computer Corporation, Assignee

Attorney's Docket No. P98-2369

Groover & Associates, P.C.

Automatic Capture and Comparison of Computer Configuration Data

The present application relates to diagnosis and service of computer faults.

5 Background and Summary of the Invention

10 In recent decades, computers have become integral tools for information processing. Businesses and individuals rely on commercially available PCs for many purposes. To be competitive, companies provide extensive customer support for the machines they sell and expend considerable resources on diagnosis and repair of computers.

15 A large number of service calls deal with problems created by recent changes in software and hardware configurations on the computer. Identifying recent configuration changes helps diagnose computer faults. Many different problems can arise during the use of computer software and hardware, so customer service needs detailed information about the specific hardware and operating system configurations from the computer to resolve problems.

20 Service personnel can gather the information they need by going to the actual site of the computer. This is expensive and usually not cost effective. More often, service personnel gather the information they need directly from the customer over the telephone. This solution is not ideal, because problems with the operation of computers may often be complex, and users do not always know what information service personnel need to resolve the service call.

25 This problem can be partially addressed by installing a diagnostics program on the customer's computer (e.g., Compaq Diagnostics for Windows) that locally collects hardware and operating system

information from the computer. The customer verbally provides this information to customer service during a service call.

Automatic Capture and Comparison of Computer Configuration Data

5 The information yielded by diagnostics programs does not identify recent configuration changes in the hardware and software. Since recent configuration changes are often the source of a computer problem, there is need for a way to generate comprehensive configuration snapshots which identify configuration changes for service
10 personnel to use during a service call.

 The present application teaches, among many things, an improved method of servicing and diagnosing computers. Computer service tools require on-line functionality to identify and resolve problems without taking the computer off-line, and a simple collection
15 process for gathering the computer information required to effectively resolve service cases. This invention provides a simplified process of capturing comprehensive information about the computer hardware and operating system and compares previous configurations with current configurations to help identify recent changes.

20 A diagnostics program captures hardware and operating system configurations when the program is installed on the computer. Later, when a computer owner calls customer service with a problem, the computer owner runs the diagnostic program, which captures the current hardware and operating system configurations. The program
25 performs this capture without the need to restart the computer or take it off-line. The original configuration settings (captured when the program was installed) serve as a baseline for comparison to the current configuration. The program output highlights any significant

changes that have occurred in the configurations and automatically updates the output file to reflect the latest configuration and differences relative to the baseline. Once this information is gathered, customer service uses it to assist in servicing the customer's computer.

- 5 By automatically performing on-line hardware and operating system information capture and displaying differences between base line and current configurations, the invention provides many advantages. It allows faster problem resolution time, since essential data is gathered and output in a format that highlights the most likely problem spots. This reduces administration costs and resource expenditure in
10 customer service and diagnostics, while maintaining or improving quality of service to the customer. Computer downtime for the customer is also reduced since service calls are resolved more quickly.

Brief Description of the Drawings

The disclosed inventions will be described with reference to the accompanying drawings, which show important sample embodiments of the invention and which are incorporated in the specification hereof by reference, wherein:

Figure 1 shows a flowchart of the diagnostic process using the present innovations.

Figure 2 shows a sample display window that the customer will see when the diagnostic is run.

Figure 3 shows a computer according to the presently preferred embodiment.

Detailed Description of the Preferred Embodiments

The numerous innovative teachings of the present application will be described with particular reference to the presently preferred embodiment. However, it should be understood that this class of
5 embodiments provides only a few examples of the many advantageous uses of the innovative teachings herein. In general, statements made in the specification of the present application do not necessarily delimit any of the various claimed inventions. Moreover, some statements may apply to some inventive features but not to others.

10 **Figure 1** shows a flow chart of the innovative process. First the program is installed and run (cpqdiag.exe) in a silent mode during installation to gather the base line computer hardware and operating system information in an ASCII text file called base.log. This file is stored in the \Windows\Cpqdiag\ directory (step 102). Later, the
15 customer has a computer problem that requires customer service assistance (step 104). The customer then runs Compaq Diagnostics System Record tool (cpqdiaga.exe) (step 106). The Compaq Diagnostics System Record tool automatically runs Compaq Diagnostics for Windows in silent mode to gather the current computer hardware and
20 operating system information in an ASCII text file called now.log (step 108). In the preferred embodiment, this data gathering is done without the need to restart the computer or take the computer off-line, because operating system level diagnostics are used. The invention could be implemented with embedded diagnostics as well.

25 The Compaq Diagnostics System Record tool compares the hardware and operating system configuration files (base.log and now.log) previously created by Compaq Diagnostics for Windows. The differences produced by the comparison are highlighted (step 110).

The output is displayed on the customer's screen in a bifurcated

window showing base line configurations on one side, the current configurations on the other. **Figure 2** shows a sample display window, with the base.log data on the left and now.log data on the right. The "free physical memory" configuration settings, **202** and **204**, differ and are therefore highlighted in the output.

Figure 3 shows a block diagram of a computer system 300 according to the presently preferred embodiment. In this example, the computer system, includes:

user input devices (*e.g.* keyboard **335** and mouse **340**);

at least one microprocessor 325 which is operatively connected to receive inputs from said input device, through an interface manager chip **330** (which also provides an interface to the various ports);

a power supply 305 which is connected to draw power from AC mains and provide DC voltage to the computer system 300 components; the innovative power supply control circuit 310, located within the power supply 305, connects to fan 100 and also interfaces to the microprocessor 325;

a memory (*e.g.* flash or non-volatile memory **355** and RAM **360**), which is accessible by the microprocessor;

a data output device (*e.g.* display **350** and video display adapter card **345**) which is connected to output data generated by microprocessor; and

a magnetic disk drive **370** which is read-write accessible, through an interface unit **365**, by the microprocessor.

Optionally, of course, many other components can be included, and this configuration is not definitive by any means. For example, the computer may also include a CD-ROM drive **380** and floppy disk drive ("FDD") **375** which may interface to the disk interface controller 365.

Additionally, L2 cache **385** may be added to speed data access from the disk drives to the microprocessor, and a PCMCIA **390** slot accommodates peripheral enhancements.

5 Comprehensive data is gathered in the ASCII text files (base.log and now.log) in steps 102 and 108 relating to the hardware and operating system configurations. The attached output offers a sample file format for the base.log and now.log output files. The information gathered in these files relates to the system itself, asset control, input devices, communication, storage, video, memory, multimedia, the
10 operating system, architecture, computer health, and various miscellaneous data.

The system data displayed includes the date and time, the name of the computer product, a machine ID, processor statistics, and system ROM information.

15 Asset control output includes the product name, which processor is used, and an asset tag.

Input devices output includes information on the keyboard and the mouse.

Communication output displays data for the various ports.

20 Storage data includes logical drive information and physical drive information.

Video output includes the current graphics resolution, the primary monitor attached, video display driver, and the video controller ROM.

25 Memory output includes the system board, total memory, and windows memory information.

Multimedia output includes data about the CDROM, the mixer device driver capabilities, the waveform output device driver capabilities, waveform input device driver capabilities, MIDI input and output

device driver capabilities, and auxiliary audio device driver capabilities.

Windows output includes which version of Windows is in use, the locations of directories, and Windows memory information.

Architecture output includes PCI device information, and whether
5 the system has PCMCIA capabilities.

Health output includes the temperature, and whether the ROM has embedded diagnostics.

Some of the miscellaneous output information deals with when
the system was last modified, BIOS data, system configuration
10 memory, interrupt vector table, a power conversion record, system
standby timeout record, screen saver record, hard drive timeout record,
security features record, processor/memory/cache record, general
system peripheral and input device information record, memory module
information record, timeout default value record, extended disk support
15 record, and a product name header record.

Further features which are contemplated as advantageous with the presently disclosed innovations are described in copending U.S. application _____, attorney docket number P98-2318, which is owned in common with the present application and has the same filing date as the present application, and which is hereby incorporated by reference.

Definitions:

Following are short definitions of the usual meanings of some of the technical terms which are used in the present application. (However, those of ordinary skill will recognize whether the context requires a different meaning.) Additional definitions can be found in the standard technical dictionaries and journals.

- Hardware:** the physical, tangible components of a computer system.
- Operating system:** a set of programs controlling the operations of a computer system, such as assemblers or input and output facilities.
- Configuration:** the collection of internal settings that controls how hardware and software function.

Modifications and Variations

As will be recognized by those skilled in the art, the innovative concepts described in the present application can be modified and varied over a tremendous range of applications, and accordingly the scope of patented subject matter is not limited by any of the specific exemplary teachings given.

In a preferred embodiment, the presently disclosed innovation is used on a computer running any of the Windows 95/98/NT/2000 operating systems. Any other operating system may be used with the present innovations.

The base and current computer hardware and operating system information is captured in ASCII text files using Compaq Diagnostics for Windows. Storage of the data in any format is within the contemplation of the invention.

The design builds on Compaq Diagnostics for Windows. However, any diagnostics program could be the foundation for the presently disclosed innovations.

The diagnostics program can be an operating system level program, or embedded diagnostics can be used.

The hardware and operating system configurations may be gathered more frequently than only at program installation and program execution. For instance, each time the hardware or operating system undergoes any configuration change, the new configuration is captured and recorded as an ASCII text file. Or, the system may run cpdiaga.exe at each startup, recording configuration changes. In embodiments where there are many sets of configurations stored, each configuration is time stamped so as to preserve a complete chronological record of configuration settings for the computer. Additionally, in embodiments that record configuration more frequently, each time

current configurations are recorded, the configurations could automatically be compared with the previous configurations, and only the changes captured in ASCII text files.

Information other than just hardware and operating system configurations can be captured by the program. Any readable information accessible to the program, be it an operating system level diagnostics program or an embedded diagnostics program, may be captured and used as a service tool. Software and DLL (Dynamic Link Library) versions could be checked. Anything stored in the Windows Registry or in any directory may also be accessed and used in servicing computers.

The amount of processing of the configuration data done by the diagnostics application can vary. The diagnostics application can merely gather and relay the configuration information, or it could perform some comparison. It could also filter the data, sending only the changes in configuration, or only send data about certain hardware or software.

Comparison and other processing of configuration data could occur at the user's computer locally, or it could be done remotely by a computer at the customer service site.

The program can prompt the user for input regarding the problem, or the data could automatically be sent without user input. Additionally, only the user input information might be sent, with or without the configuration data. These options can be made available as user selected options, or they may be made automatic so that the user need not initiate them.

It should also be noted that the disclosed innovative ideas are not limited only to systems based on an x86-compatible microprocessor, but can also be implemented in systems using 680x0, RISC, or other

processor architectures.

It should also be noted that the disclosed innovative ideas are not by any means limited to systems using a single-processor CPU, but can also be implemented in computers using multiprocessor architectures.

- 5 Additional general background, which helps to show the knowledge of those skilled in the art regarding the system context, and of variations and options for implementations, may be found in the following publications, all of which are hereby incorporated by reference. In particular, many details may be found in the books from
- 10 MindShare, Inc., including PROTECTED MODE SOFTWARE ARCHITECTURE, CARDBUS SYSTEM ARCHITECTURE, EISA SYSTEM ARCHITECTURE, ISA SYSTEM ARCHITECTURE, 80486 SYSTEM ARCHITECTURE, PENTIUM PROCESSOR SYSTEM ARCHITECTURE, PCMCIA SYSTEM ARCHITECTURE, PLUG AND PLAY SYSTEM ARCHITECTURE, PCI
- 15 SYSTEM ARCHITECTURE, USB SYSTEM ARCHITECTURE, and PENTIUM PRO PROCESSOR SYSTEM ARCHITECTURE, all of which are hereby incorporated by reference, and in the PENTIUM PROCESSOR FAMILY DEVELOPER'S MANUAL 1997, the MULTIPROCESSOR SPECIFICATION (1997), the INTEL ARCHITECTURE OPTIMIZATIONS MANUAL, the INTEL
- 20 ARCHITECTURE SOFTWARE DEVELOPER'S MANUAL, the PERIPHERAL COMPONENTS 1996 databook, the PENTIUM PRO PROCESSOR BIOS WRITER'S GUIDE (version 2.0, 1996), and the PENTIUM PRO FAMILY DEVELOPER'S MANUALS from Intel, all of which are hereby incorporated by reference.

CLAIMS

What is claimed is:

- 1 1. A method of servicing a computer, the computer including hardware
2 and an operating system, comprising the steps of:
3 capturing base configuration data for the computer;
4 capturing the current configuration data; and
5 automatically comparing the base and current configuration data.
- 1 2. The method of Claim 1, wherein the configuration data relates to the
2 hardware and operating system of the computer.
- 1 3. The method of Claim 1, wherein the base configuration data is
2 captured and stored more than once before current configuration
3 data is captured.
- 1 4. The method of Claim 1, wherein the configuration data is stored as
2 an ASCII text file.
- 1 5. The method of Claim 1, wherein the base data is captured by a
2 diagnostics program on the computer at the time the diagnostics
3 program is installed.
- 1 6. The method of Claim 1, further comprising the step of highlighting
2 the differences between the base and current configuration data.
- 1 7. The method of Claim 1, wherein the step of comparing is done at
2 the user's computer.

1 8. The method of Claim 1, wherein the configuration data captured
2 includes information on the computer's memory.

1 9. A method of servicing a computer, comprising the steps of:
2 when there is a problem with the computer, running a diagnostic
3 program that captures the configuration data of hardware and
4 operating system on the computer;
5 comparing the configuration data with a base set of configuration
6 data; and
7 sending configuration data to a remote computer.

1 10. The method of Claim 9, wherein the comparison is used to service
2 the computer.

1 11. The method of Claim 9, further comprising the step of highlighting
2 the differences between the base and current configuration data.

1 12. The method of Claim 9, wherein multiple sets of configuration data
2 are captured and compared to each other and the base configura-
3 tion.

1 13. The method of Claim 12, wherein all sets of configuration data are
2 time stamped.

- 1 14. A software and hardware diagnostics architecture for a computer,
2 comprising:
3 a diagnostics program installed on the computer capable of captur-
4 ing configuration data from the computer
5 wherein when computer service procedures are initiated, the
6 program captures a base set of configuration data, and later
7 captures a current set of configuration data for comparison to
8 the base set of configuration data, the comparison used to
9 service the computer.
- 1 15. The architecture of Claim 14, wherein the configuration data
2 relates to hardware and operating system settings on the comput-
3 er.
- 1 16. The architecture of Claim 14, wherein the diagnostics program
2 captures configuration data on installation and on at least one
3 other occasion.
- 1 17. The architecture of Claim 14, wherein differences between the base
2 and current configuration data are highlighted.
- 1 18. The architecture of Claim 14, wherein the base and current
2 configuration data are stored in ASCII text files.
- 1 19. The architecture of Claim 14, wherein the configuration data
2 captured is any data in the computer.

1 20. A computer, comprising:
2 a diagnostics program installed on the computer capable of captur-
3 ing current configuration data from the computer;
4 stored base configuration data for the computer;
5 wherein the current configuration data is compared to the base
6 configuration data.

1 21. The computer of Claim 20, wherein the configuration data relates
2 to hardware and operating system settings on the computer.

1 22. The computer of Claim 20, wherein a program other than the
2 diagnostics program compares the base and current configuration
3 data.

1 23. The computer of Claim 20, wherein the base data is captured when
2 the diagnostics program is installed.

1 24. The computer of Claim 20, wherein the differences between the
2 base and current configuration data are highlighted.

ABSTRACT

A method of customer service that uses a program which captures the computer's hardware and operating system configuration when the program is installed, and also captures the hardware and operating
5 system configuration upon request (when the user needs customer service help), and compares the two, highlighting differences.

Copyright © 1998 Compaq Computer Corporation

Run Compaq Diagnostics for Windows application (cpqdiag.exe) in a silent mode during installation to gather current hardware and operating system information in an ASCII text file called base.log in the \Windows\Cpqdiag\ directory.

step 102

Customer has a problem with the computer that requires customer service assistance.

step 104

Customer runs Compaq Diagnostics System Record tool (cpqdiaga.exe)

step 106

The Compaq Diagnostics System Record tool automatically runs Compaq Diagnostics for Windows in silent mode to gather the current computer hardware and operating system information in an ASCII text file called now.log.

step 108

Compaq Diagnostics System Record tool performs comparison of the hardware and operating system configuration files previously created by Compaq Diagnostics for Windows. The differences produced by the comparison are highlighted.

step 110

FIG. 3

DECLARATION**SOLE/JOINT INVENTOR
ORIGINAL**

As a below named inventor, I hereby declare that: my residence, post office address, and citizenship are as stated below next to my name. I believe I am the original, first, and sole inventor (if only one name is listed below) or a joint inventor (if plural inventors are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

Automatic Capture and Comparison of Computer Configuration Data

as described in the specification attached.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above; that I do not know and do not believe the same was ever known or used in the United States of America before my or our invention thereof, or patented or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application; that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representative or assigns more than twelve months prior to this application; and that I acknowledge the duty to disclose information of which I am aware which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations § 1.56(a). Such information is material when it is not cumulative to information already of record or being made of record in the application, and

- (1) it establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
- (2) it refutes, or is inconsistent with, a position the applicant has taken or may take in:
 - (i) opposing an argument of unpatentability relied on by the Office, or
 - (ii) asserting an argument of patentability.

I hereby claim foreign priority benefits under Title 35, United States Code § 119 of any foreign application(s) for patent or inventor's certificates listed below and have also identified below any foreign application(s) having a filing date before that of the application(s) on which priority is claimed:

COUNTRY	APPLICATION NUMBER	DATE OF FILING	PRIORITY CLAIMED UNDER 35 USC 119
			<input type="checkbox"/> YES <input type="checkbox"/> NO

I hereby claim the benefit under Title 35 United States Code § 120 of any United States application(s) listed below and, insofar as any subject matter of any claim of this application is not disclosed in the prior United States Application, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations § 1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
